Description: . SeDiv 2.3.5.0 hard drive repair tool FULL VERSION.rar. 710 In a storage apparatus such as a RAID (redundant array of independent/inexpensive disks) storage apparatus that stores logical volumes, the virtual address space of a physical storage apparatus comprises a plurality of virtual address ranges. There is a virtual address range called "low virtual address range" in which each virtual address corresponds to one physical block. One virtual address range corresponding to the total storage capacity of one physical block, the virtual address range called "high virtual address range", is larger than the low virtual address range. A virtual address in the high virtual address range is composed from a logical address space of one physical storage apparatus and a physical block number of one physical block. It is noted that the number of physical blocks included in one physical block may change from physical block to physical block in a physical storage apparatus. A storage apparatus stores data with a virtual address in the high virtual address range instead of storing data in a physical block corresponding to the virtual address in the low virtual address range in the case of a write request to the storage apparatus. A storage apparatus stores data with a virtual address in the low virtual address range corresponding to a physical block in which the data is stored in the physical storage apparatus in the case of a read request to the storage apparatus. In the case of a read request, a logical address space of one physical storage apparatus has been stored in a virtual address space of a virtual file system. Such a virtual address space comprises a high virtual address range and a f678ea9f9e
